

## **Comp 2005**

### **Iteration Plan 3**

For our third iteration, we will implement the “Display Data” use case. We will allow the user to view their imported data. The user will be able to view workout statistics between two dates. By default, a table of all the users logged workout information will be displayed underneath the ‘Import Data” button.. Above this table (but below the “Import Data” button) will be 2 calendar widgets. On these widgets, the user will select a start and end date, and our application will display a table of their workouts logged between those dates. The table will have columns for date, duration, altitude, and distance.
