Chapter 1

COMP-2005 Activity Tracker Documentation

This website contains documentation for all source code contained in the *Activity Tracker* application. Class and method documentation may be accessed in HTML format using the left-hand side navigation bar, or the search box at the top right-hand side of the page.

For offline viewing, a precompiled PDF of this documentation has been made available [here](#) Note, however, that this document does *not* contain the full source code which is included in formatted HTML on this website.

More detailed information about contributions, repository branches, and commit history is available by browsing the [GitHub repository](#) for this project.

Chapter 2

Namespace Index

2.1 Packages

Here are the packages with brief descriptions (if available):

com	11
com.activitytracker	11

Chapter 3

Hierarchical Index

3.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

com.activitytracker.ActivityTracker	13
com.activitytracker.DBManager	17
com.activitytracker.Iteration3Test	29
JDialog	
com.activitytracker.CreateUserWindow	14
JFrame	
com.activitytracker.LoginWindow	30
com.activitytracker.MainWindow	34
com.activitytracker.Run	38
com.activitytracker.RunAttribute	42
com.activitytracker.SecureString	43
com.activitytracker.User.Sex	48
com.activitytracker.User	49
com.activitytracker.UserAttribute	54

Chapter 4

Class Index

4.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

com.activitytracker.ActivityTracker	13
com.activitytracker.CreateUserWindow	14
com.activitytracker.DBManager	17
com.activitytracker.Iteration3Test	29
com.activitytracker.LoginWindow	30
com.activitytracker.MainWindow	34
com.activitytracker.Run	38
com.activitytracker.RunAttribute	42
com.activitytracker.SecureString	43
com.activitytracker.User.Sex	48
com.activitytracker.User	49
com.activitytracker.UserAttribute	54

Chapter 5

File Index

5.1 File List

Here is a list of all files with brief descriptions:

app/src/com/activitytracker/ ActivityTracker.java	57
app/src/com/activitytracker/ CreateUserWindow.java	57
app/src/com/activitytracker/ DBManager.java	57
app/src/com/activitytracker/ Iteration3Test.java	58
app/src/com/activitytracker/ LoginWindow.java	58
app/src/com/activitytracker/ MainWindow.java	58
app/src/com/activitytracker/ Run.java	58
app/src/com/activitytracker/ RunAttribute.java	59
app/src/com/activitytracker/ SecureString.java	59
app/src/com/activitytracker/ User.java	59
app/src/com/activitytracker/ UserAttribute.java	59

- boolean [executeUpdate](#) (final String sqlQuery)
- boolean [isEmpty](#) ()

Private Attributes

- Connection `m_conn` = null

7.3.1 Detailed Description

Singleton class for the database. All classes and methods that interact with the database will use a method in this class.

Many times we are faced with the "chicken and egg" problem where we wish to create an object that is populated with information from the database. So the question one faces is, "does the object's constructor query the database (through the `DBManager` class, of course) for each attribute of the object that it wishes to retrieve, or do we directly interact with a `DBManager` method which will then return a `User` or `Workout` object, for example?" We have decided to use the former methodology, with `DBManager` methods being as general as possible, and often accepting enum types which then are put into a switch to create the specific SQL query we wish to execute. This works best when all data returned is of the same data type (for example, the `Workout` class will have three float attributes at the time of writing so we use one method with return type of float for returning `Workout` attributes). This does not work as well when the object requires data of multiple types — for example, the `User` class. In this case, we have split the `DBManager` methods into a single method for each attribute being returned.

Polymorphism could theoretically be used here to simply have a return type of `Object`, however this is not flexible and requires casting *all* returned data to the correct type in the invoking method.

Definition at line 25 of file `DBManager.java`.

7.3.2 Constructor & Destructor Documentation

7.3.2.1 `DBManager()`

```
com.activitytracker.DBManager.DBManager ( ) [package]
```

Creates a new `DBManager` object.

This should only be called once, from the main program, as `DBManager` is meant to be a *singleton* class.

This constructor takes no parameters as verification of the SQLite database is done in the `init()` method of this class, which returns information about whether the initialization was successful or not.

Definition at line 42 of file `DBManager.java`.

7.3.3 Member Function Documentation

7.3.3.1 createUser()

```
void com.activitytracker.DBManager.createUser (
    final String name,
    final String emailAddress,
    final int DOBYear,
    final int DOBMonth,
    final int DOBDay,
    final User.Sex sex,
    final float height,
    final float weight,
    final SecureString securePassword ) throws AssertionError
```

Adds a row for a user to the Users table in the SQLite database for the app.

Requires that the database tables exist and are in the correct format. If the user exists in the database this method raises an AssertionError exception.

Parameters

<i>name</i>	User's name
<i>emailAddress</i>	User's email address; used to authenticate
<i>DOBYear</i>	The year the user was born
<i>DOBMonth</i>	The month the user was born
<i>DOBDay</i>	The day of month the user was born
<i>sex</i>	The user's sex; is either User.Sex.MALE or User.Sex.FEMALE
<i>height</i>	Floating point number of the user's height in metres
<i>weight</i>	Floating point number of the user's weight in kilograms
<i>securePassword</i>	A SecureString object containing the user's password, encrypted

Definition at line 61 of file DBManager.java.

7.3.3.2 executeQuery()

```
ResultSet com.activitytracker.DBManager.executeQuery (
    final String sqlQuery ) [private]
```

A wrapper method for processing *safe* SQL queries.

By safe we mean that the SQL query string is entirely hard-coded in the program source code. In other words, no user input is added. This is an important distinction as the former may leave the application vulnerable to SQL injection.

In such cases, a SQL PreparedStatement should be used.

Parameters

<i>sqlQuery</i>	The SQL code to be executed. Must be a <i>SELECT</i> statement.
-----------------	---

Returns

This method returns a `ResultSet` containing the returned row(s) and/or column(s) of the SQL query that was executed.

Definition at line 680 of file `DBManager.java`.

7.3.3.3 `executeUpdate()`

```
boolean com.activitytracker.DBManager.executeUpdate (
    final String sqlQuery ) [private]
```

A wrapper method for processing *safe* SQL queries.

By safe we mean that the SQL query string is entirely hard-coded in the program source code. In other words, no user input is added. This is an important distinction as the former may leave the application vulnerable to SQL injection.

In such cases, a SQL `PreparedStatement` should be used.

Parameters

<i>sqlQuery</i>	The SQL code to be executed. Must be an <i>INSERT</i> or <i>UPDATE</i> statement.
-----------------	---

Returns

This method returns a boolean indicating if the query was successful.

Definition at line 708 of file `DBManager.java`.

7.3.3.4 `getDateOfBirth()`

```
Date com.activitytracker.DBManager.getDateOfBirth (
    final int id )
```

Retrieves the user's date of birth (DOB) from the database.

At the time of writing, this method is only being used in the [User](#) constructor.

Parameters

<i>id</i>	Unique ID used to associate information in the database to this user.
-----------	---

Returns

This method returns a `Date` object containing the user's DOB (i.e., year, month, day).

Definition at line 298 of file DBManager.java.

7.3.3.5 getRunFloatAttribute()

```
float com.activitytracker.DBManager.getRunFloatAttribute (
    final RunAttribute attribute,
    final int rID )
```

Retrieves a run's attribute as a floating point number, where applicable, from the database.

This method accepts a [RunAttribute](#) enumeration type to specify what attribute it is returning from the database. Only certain attributes are accepted by this method, namely those that are stored as real values. Attributes stored as other data types should use the appropriate accessor method.

Parameters

<i>attribute</i>	<p>The attribute that the method is supposed to query the DB for and return the value of. Note that only certain RunAttribute types are supported in this method.</p> <ul style="list-style-type: none"> • When <i>attribute</i> is RunAttribute.DURATION, the run's duration is returned. • When <i>attribute</i> is RunAttribute.DISTANCE, the run's cumulative distance is returned in metres. • When <i>attribute</i> is RunAttribute.ALTITUDE_ASCENDED, the run's cumulative altitude climbed is returned in metres • When <i>attribute</i> is RunAttribute.ALTITUDE_DESCENDED, the run's cumulative altitude descended is returned in metres
<i>rID</i>	<p>Unique ID corresponding to the row in the Runs table that we wish to query. If such an ID does not exist, <i>0.0f</i> will be returned.</p>

Returns

This method returns a float containing run attribute as specified by the *attribute* parameter.

Definition at line 585 of file DBManager.java.

7.3.3.6 getUserFloatAttribute()

```
float com.activitytracker.DBManager.getUserFloatAttribute (
    final UserAttribute attribute,
    final int id )
```

Retrieves a user's attribute in floating point format, when applicable, from the database's Users table.

This method accepts a [UserAttribute](#) enumeration type to specify what attribute it is returning from the database. Only certain attributes are accepted by this method, namely those that are stored as real values. Attributes stored as other data types should use the appropriate accessor method.

Parameters

<i>attribute</i>	<p>The attribute that the method is supposed to query the DB for and return the value of. Note that only certain UserAttribute types are supported in this method.</p> <ul style="list-style-type: none"> When <i>attribute</i> is UserAttribute.WEIGHT, this method retrieves the user's weight from the database. When <i>attribute</i> is UserAttribute.HEIGHT, this method retrieves the user's height from the database.
<i>id</i>	Unique ID used to associate information in the database to this user.

Returns

Returns a floating point number corresponding to the [UserAttribute](#) passed to the method, for the user specified by *id*.

Definition at line 257 of file DBManager.java.

7.3.3.7 getUserIDByEmail()

```
int com.activitytracker.DBManager.getUserIDByEmail (
    final String emailAddress )
```

As we are using the user's email address as their identifying attribute, they will supply this when they log in. Hence, as the database relates everything to the user's unique ID, we must retrieve this ID given the email address.

The logic behind this method relies on the database Users table structure making *email_address* a unique field.

Parameters

<i>emailAddress</i>	The user's email address with which they authenticate.
---------------------	--

Returns

This method returns a unique integer corresponding to the row in the database's Users table that stores user information for user with email address *emailAddress*.

Definition at line 155 of file DBManager.java.

7.3.3.8 getUserLastRID()

```
int com.activitytracker.DBManager.getUserLastRID (
    final int id )
```

Retrieves the last workout ID that the user added as an integer from the database.

This is used because of the format in which the data is supplied. As the only way to denote a new workout is by receiving (0, 0, 0) in the input file, if the input is *not* (0, 0, 0), we need to update the previously added workout with the latest line. Hence we need some way of storing an identifier for this workout. As this is unique to each user, we have chosen to store this in the Users table of the database.

Parameters

<i>id</i>	Unique ID used to associate information in the database to this user.
-----------	---

Returns

An integer corresponding to the last row in the Workouts table that the user created.

Definition at line 395 of file DBManager.java.

7.3.3.9 getUserPassSalt()

```
byte [] com.activitytracker.DBManager.getUserPassSalt (
    final int id )
```

Retrieves a byte array containing the salt used to encrypt the user's password from the database.

This is necessary because to compare a candidate password supplied by a user to a known (encrypted) password stored in the database, we must encrypt the new candidate password using the same salt as was originally used.

Parameters

<i>id</i>	Unique ID used to associate information in the database to this user.
-----------	---

Returns

This method returns a byte array containing the user's password encryption salt.

Definition at line 366 of file DBManager.java.

7.3.3.10 getUserSex()

```
User.Sex com.activitytracker.DBManager.getUserSex (
    final int id )
```

Retrieves the user's gender from the database.

We have chosen to represent gender in the SQLite database with the data type BIT(1), where 1 denotes male and 0 denotes female. Hence, if the database contains 1 this method returns [User.Sex.MALE](#) and if the database contains 0 then this method returns [User.Sex.FEMALE](#).

At the time of writing, this method is only being used in the [User](#) constructor.

Parameters

<i>id</i>	Unique ID used to associate information in the database to this user.
-----------	---

Returns

This method returns a [User.Sex](#) enumeration type corresponding to the user's gender.

Definition at line 333 of file DBManager.java.

7.3.3.11 getUserStringAttribute()

```
String com.activitytracker.DBManager.getUserStringAttribute (
    final UserAttribute attribute,
    final int id )
```

This method retrieves a string, varchar, text, or char field, when applicable, from the database's Users table.

This method accepts a [UserAttribute](#) enumeration type to specify what attribute it is returning from the database. Only certain attributes are accepted by this method, namely those that are stored as string-like values. Attributes stored as other data types should use the appropriate accessor method.

Parameters

<i>attribute</i>	<p>The attribute that the method is supposed to query the DB for and return the value of. Note that only certain UserAttribute types are supported in this method.</p> <ul style="list-style-type: none"> When <i>attribute</i> is UserAttribute.PASSWORD, this method retrieves the user's encrypted password from the database. Typically this will be used in the following sequence of calls: <ol style="list-style-type: none"> User attempts to authenticate with email and password Their unique ID is retrieved from the database using DBManager::getUserIDByEmail() Their ID is used to retrieve the hash of their password (i.e., this method is called) The returned string from this method is compared a SecureString generated from the candidate password supplied by the user when authenticating. When <i>attribute</i> is UserAttribute.NAME, this method retrieves the user's full name from the database (e.g., "John Doe"). When <i>attribute</i> is UserAttribute.EMAIL_ADDRESS, this method retrieves the user's email address from the database. Note that this is likely somewhat redundant as the user will always be required to authenticate by providing their email address and hence it will already be available to the User constructor, which is likely what is invoking this method.
<i>id</i>	Unique ID used to associate information in the database to this user.

Returns

This method returns a string containing attribute specified by the *attribute* parameter for the user specified by the *id* parameter.

Definition at line 203 of file DBManager.java.

7.3.3.12 init()

```
boolean com.activitytracker.DBManager.init (
    final String dbURL ) [package]
```

Initializes a connection to the SQLite database.

As no work is done in the [DBManager\(\)](#) constructor, this method should be called immediately after creating the single instance of [DBManager](#) that the application is to use.

This method will attempt to connect to the database file specified by the *dbURL* parameter, creating the file and all required tables if it/they do not exist. You are encouraged to view the source code of this method for more information about the database schema used.

If all of the above is successful, the method returns True. Otherwise, False is returned.

Parameters

<i>dbURL</i>	A file system path to the SQLite database file.
--------------	---

Returns

This method returns True if the database can be initialized, or False otherwise.

Definition at line 762 of file DBManager.java.

7.3.3.13 isEmpty()

```
boolean com.activitytracker.DBManager.isEmpty ( ) [private]
```

Returns a boolean value depending on whether or not the database is populated.

This is done by retrieving tables in the database and checking if this iterator has a next(). If not then there are no tables in the database and we consider it to be empty.

Returns

Returns True if there are tables in the database, False otherwise.

Definition at line 730 of file DBManager.java.

7.3.3.14 newRun()

```
int com.activitytracker.DBManager.newRun (
    final int userID,
    final int year,
    final int month,
    final int day,
    final float duration,
    final float distance,
    final float altitude_ascended,
    final float altitude_descended )
```

Creates a new row in the Runs table with the attributes provided as parameters.

In particular, this method will be called when [Run::newRunDataPoint\(\)](#) receives (0, 0, 0) for (*duration*, *distance*, *altitude*).

Parameters

<i>userID</i>	Unique ID used to associate information in the database to this user.
<i>year</i>	Year that the run was completed.
<i>month</i>	Month that the run was completed (1-12).
<i>day</i>	Day that the run was completed (1-31).
<i>duration</i>	Duration of the run in seconds.
<i>distance</i>	Distance ran in metres.
<i>altitude_ascended</i>	Cumulative altitude climbed in metres.
<i>altitude_descended</i>	Cumulative altitude descended in metres.

Returns

Returns a unique integer corresponding to the new row in the SQLite Workouts table by which the new entry can be identified.

Definition at line 459 of file DBManager.java.

7.3.3.15 runExists()

```
boolean com.activitytracker.DBManager.runExists (
    final int rID )
```

Determines if a given run ID exists in the database.

Parameters

<i>rID</i>	Unique ID corresponding to the row in the Runs table that we wish to check exists.
------------	--

Returns

This method returns True if the run row with ID *WOID* exists in the database, or False otherwise.

Definition at line 636 of file DBManager.java.

7.3.3.16 setRun()

```
void com.activitytracker.DBManager.setRun (
    final int rID,
    final float duration,
    final float distance,
    final float altitude_ascended,
    final float altitude_descended )
```

Updates a run entry in the database as new information becomes available from the input file.

In particular, this method is called when [Run::newRunDataPoint\(\)](#) receives non-(0, 0, 0) input for (*duration*, *distance*, *altitude*).

This method will not be called directly by the application, rather it is called from [Run::newRunDataPoint\(\)](#). Hence that method will take care of adding/subtracting to/from the current stored values for *duration*, *distance*, and *altitude* — here we just take the input and put it in the database.

Parameters

<i>rID</i>	Unique ID used to identify a run in the database.
<i>duration</i>	The number of seconds the user's run lasted.
<i>distance</i>	The cumulative number of metres the user ran.
<i>altitude_ascended</i>	The cumulative number of metres the user climbed.
<i>altitude_descended</i>	The cumulative number of metres the user descended.

Definition at line 533 of file DBManager.java.

7.3.3.17 setUserLastRID()

```
void com.activitytracker.DBManager.setUserLastRID (
    final int id,
    final int lastRID )
```

Updates a user's last run ID in the database.

This method will be used to update the run that a particular user last created. This is used when creating new run as the format of the input file requires that we maintain a record of what run we must update if the next line in the file is *not* (0, 0, 0).

See [getUserLastRID\(\)](#) for more information on the user of the *last_run* field in the database.

Parameters

<i>id</i>	Unique ID used to associate information in the database to this user.
<i>lastRID</i>	Integer corresponding to the last row in the Workouts table that the user with ID <i>id</i> created.

Definition at line 426 of file DBManager.java.

7.3.3.18 userExists()

```
boolean com.activitytracker.DBManager.userExists (
    final String emailAddress )
```

The [DBManager::userExists\(\)](#) method is designed to facilitate the user experience (UX) design choice of users creating one account to the app and logging in with an existing account for future use. This maintains saved (persistent) data and helps enforce the unique constraint placed on the *email_address* field in the database (again, as users are authenticating using their email address as a user name to identify themselves).

Parameters

<i>emailAddress</i>	The user's email address for which we are checking existence. We use email address here because this is what the user uses to log in to the app.
---------------------	--

Returns

True if the user exists in the database, false otherwise.

Definition at line 124 of file DBManager.java.

7.3.4 Member Data Documentation

7.3.4.1 m_conn

```
Connection com.activitytracker.DBManager.m_conn = null [private]
```

The *m_conn* variable in the [DBManager](#) class is initially assigned the value of *null*.

When [DBManager::init\(\)](#) is invoked, it is made to be the connection to the database and is subsequently used each time a new SQL statement is created.

7.7 com.activitytracker.Run Class Reference

Collaboration diagram for com.activitytracker.Run:

Static Public Member Functions

- static void `newRunDataPoint` (final `DBManager dbManager`, final `User user`, final float `duration`, final `Date date`, final float `distance`, final float `altitude`)
- static `Run []` `getRuns` (final `DBManager dbManager`, final `Date startDate`, final `Date endDate`)

Package Functions

- `Run` (final `DBManager dbManager`, final int `rID`)

Package Attributes

- `Date date`
- `DBManager dbManager`
- float `duration`
- float `distance`
- float `altitude_ascended`
- float `altitude_descended`
- long `caloriesBurned` = 0

7.7.1 Detailed Description

Used to logically instantiate a run.

Definition at line 9 of file `Run.java`.

7.7.2 Constructor & Destructor Documentation

7.7.2.1 Run()

```
com.activitytracker.Run.Run (
    final DBManager dbManager,
    final int rID ) [package]
```

The [Run\(\)](#) constructor is used to retrieve workout information from the database and instantiate each row of the Runs table in a logical format.

Parameters

<i>dbManager</i>	The connection to the database.
<i>rID</i>	The run ID used to retrieve information from the database.

Definition at line 48 of file Run.java.

7.7.3 Member Function Documentation

7.7.3.1 getRuns()

```
static Run [] com.activitytracker.Run.getRuns (
    final DBManager dbManager,
    final Date startDate,
    final Date endDate ) [static]
```

Definition at line 101 of file Run.java.

7.7.3.2 newRunDataPoint()

```
static void com.activitytracker.Run.newRunDataPoint (
    final DBManager dbManager,
    final User user,
    final float duration,
    final Date date,
    final float distance,
    final float altitude ) [static]
```

Definition at line 58 of file Run.java.

7.7.4 Member Data Documentation

7.7.4.1 altitude_ascended

```
float com.activitytracker.Run.altitude_ascended [package]
```

The altitude (in metres) that the user climbed throughout the run.

Definition at line 29 of file Run.java.

7.7.4.2 altitude_descended

```
float com.activitytracker.Run.altitude_descended [package]
```

The altitude (in metres) that the user descended throughout their run.

Definition at line 33 of file Run.java.

7.7.4.3 caloriesBurned

```
long com.activitytracker.Run.caloriesBurned = 0 [package]
```

The number of calories that the user burned throughout their run.

Currently this is not being used; it is for future features.

Definition at line 39 of file Run.java.

7.7.4.4 date

```
Date com.activitytracker.Run.date [package]
```

The date the run occurred.

Definition at line 13 of file Run.java.

7.7.4.5 dbManager

```
DBManager com.activitytracker.Run.dbManager [package]
```

The run's connection to the database. This is used to add data points and retrieve workout metadata.

Definition at line 17 of file Run.java.

7.7.4.6 distance

```
float com.activitytracker.Run.distance [package]
```

The distance (in metres) that the user ran.

Definition at line 25 of file Run.java.

7.7.4.7 duration

```
float com.activitytracker.Run.duration [package]
```

The length of the run in seconds.

Definition at line 21 of file Run.java.

7.8 com.activitytracker.RunAttribute Enum Reference

Public Attributes

- [DISTANCE](#)
- [DURATION](#)
- [ALTITUDE_ASCENDED](#)
- [ALTITUDE_DESCENDED](#)

7.8.1 Detailed Description

This enumeration type is used to specify the behaviour of generalized methods, particularly in the [DBManager](#) class.

Definition at line 6 of file RunAttribute.java.

7.8.2 Member Data Documentation

7.8.2.1 ALTITUDE_ASCENDED

```
com.activitytracker.RunAttribute.ALTITUDE_ASCENDED
```

The cumulative altitude (in metres) that the user has climbed throughout their run.

Used in [DBManager::getRunFloatAttribute](#) to specify that ascended altitude should be returned.

Definition at line 24 of file RunAttribute.java.

7.8.2.2 ALTITUDE_DESCENDED

```
com.activitytracker.RunAttribute.ALTITUDE_DESCENDED
```

The cumulative altitude (in metres) that the user has descended throughout their run.

Used in [DBManager::getRunFloatAttribute](#) to specify that descended altitude should be returned.

Definition at line 30 of file RunAttribute.java.

7.8.2.3 DISTANCE

```
com.activitytracker.RunAttribute.DISTANCE
```

The cumulative distance the user has run (in metres).

Used in [DBManager::getRunFloatAttribute](#) to specify that distance should be returned.

Definition at line 12 of file RunAttribute.java.

7.8.2.4 DURATION

```
com.activitytracker.RunAttribute.DURATION
```

The duration of the user's run (in seconds).

Used in [DBManager::getRunFloatAttribute](#) to specify that duration should be returned.

Definition at line 18 of file RunAttribute.java.

The documentation for this enum was generated from the following file:

- [app/src/com/activitytracker/RunAttribute.java](#)

7.9 com.activitytracker.SecureString Class Reference

Public Member Functions

- boolean [equalString](#) (final String other)
- byte [] [getSalt](#) ()
- String [toString](#) ()

Package Functions

- [SecureString](#) (final String plaintext)
- [SecureString](#) (final String plaintext, final byte[] salt)

Private Member Functions

Static Private Member Functions

- static byte [] [generateSalt](#) () throws NoSuchAlgorithmException

Private Attributes

- String [secureString](#)
- byte [] [salt](#)

7.9.1 Detailed Description

This class is used to securely store sensitive string-like information such as user passwords.

Definition at line 10 of file SecureString.java.

7.9.2 Constructor & Destructor Documentation

7.9.2.1 SecureString() [1/2]

```
com.activitytracker.SecureString.SecureString (
    final String plaintext ) [package]
```

The [SecureString\(\)](#) constructor takes as an argument a plain text string, encrypts it, and stores the encrypted string in the variable [SecureString::secureString](#).

Salt is generated using [SecureString::generateSalt\(\)](#).

Parameters

<i>plaintext</i>	The string to be encrypted. May contain sensitive information.
------------------	--

Definition at line 29 of file SecureString.java.

7.9.2.2 SecureString() [2/2]

```
com.activitytracker.SecureString.SecureString (
    final String plaintext,
    final byte [] salt ) [package]
```

The [SecureString\(\)](#) constructor takes as an argument a plain text string and a previously-generated salt, encrypts the plain text string with the provided salt, and stores the encrypted string in the variable [SecureString::secureString](#).

Parameters

<i>plaintext</i>	The string to be encrypted. May contain sensitive information.
<i>salt</i>	Salt that is used to encrypt <i>plaintext</i> . This parameter is used whenever we wish to encrypt using a previously-generated salt for the purpose of encrypted string comparison.

Definition at line 50 of file SecureString.java.

7.9.3 Member Function Documentation

7.9.3.1 equalString()

```
boolean com.activitytracker.SecureString.equalString (
    final String other )
```

Compares the secure string to the *other* parameter for equality.

This method will likely be used to authenticate a user from a password hash existing in the database.

Parameters

<i>other</i>	A (previously encrypted) string with which we compare SecureString::secureString .
--------------	--

Returns

This method returns True if the hashes of both strings are the same, and False otherwise.

Definition at line 66 of file SecureString.java.

7.9.3.2 generateSalt()

```
static byte [] com.activitytracker.SecureString.generateSalt ( ) throws NoSuchAlgorithmException↔
Exception [static], [private]
```

This method generates salt for encryption of a plain text string.

Returns

Returns a byte array of length sixteen (16) containing the encryption salt.

Exceptions

<i>NoSuchAlgorithmException</i>	Required as <i>SecureRandom.getInstance()</i> may throw this exception and we would like the invoking method to decide how to handle it rather than catching and dismissing it here.
---------------------------------	--

Definition at line 83 of file SecureString.java.

7.9.3.3 generateSecureString()

```
String com.activitytracker.SecureString.generateSecureString (
    final String strToSecure,
    final byte [] salt ) [private]
```

Encrypt string and return secure version.

Due to the importance of securely storing passwords, a "tried and true" method for encrypting passwords found at [this link](#) has been used.

Parameters

<i>strToSecure</i>	The plain text string we wish to encrypt.
<i>salt</i>	The salt with which we will encrypt <i>strToSecure</i> .

Returns

This private method returns the encrypted string to the [SecureString\(\)](#) constructor.

Definition at line 102 of file SecureString.java.

7.9.3.4 getSalt()

```
byte [] com.activitytracker.SecureString.getSalt ( )
```

Returns

Returns the byte array-type salt used to encrypt the text given to the object's constructor.

Definition at line 123 of file SecureString.java.

7.9.3.5 toString()

```
String com.activitytracker.SecureString.toString ( )
```

Overriden method to return the object as a Java String.

The encrypted string will be returned, though it should be noted for completeness that this is not a full representation of the object since the salt is crucial in arriving at [SecureString::secureString](#) being returned.

Returns

Returns the encrypted string.

Definition at line 136 of file SecureString.java.

7.9.4 Member Data Documentation

7.9.4.1 salt

```
byte [] com.activitytracker.SecureString.salt [private]
```

The salt that was used to encrypt the plain text string.

Definition at line 19 of file SecureString.java.

7.9.4.2 secureString

```
String com.activitytracker.SecureString.secureString [private]
```

The encrypted string.

Definition at line 15 of file SecureString.java.

The documentation for this class was generated from the following file:

- [app/src/com/activitytracker/SecureString.java](#)

7.10 com.activitytracker.User.Sex Enum Reference

Public Attributes

- [MALE](#)
- [FEMALE](#)

7.10.1 Detailed Description

Used to represent whether the user is male or female.

Definition at line 12 of file User.java.

7.10.2 Member Data Documentation

7.10.2.1 FEMALE

```
com.activitytracker.User.Sex.FEMALE
```

Used to represent that the user is female.

Recall from the source code included in [DBManager::init\(\)](#) that sex is stored in the database using a data type of BIT(1). If the user is female, we store this in the database by populating this field with a *0*.

Definition at line 26 of file User.java.

7.10.2.2 MALE

```
com.activitytracker.User.Sex.MALE
```

Used to represent that the user is male.

Recall from the source code included in [DBManager::init\(\)](#) that sex is stored in the database using a data type of BIT(1). If the user is female, we store this in the database by populating this field with a *0*.

Definition at line 19 of file User.java.

The documentation for this enum was generated from the following file:

7.11.1 Detailed Description

Definition at line 8 of file User.java.

7.11.2 Constructor & Destructor Documentation

7.11.2.1 User()

```
com.activitytracker.User.User (
    final DBManager dbManager,
    final String emailAddress,
    final String plaintextPassword ) throws AuthenticationException [package]
```

Definition at line 38 of file User.java.

7.11.3 Member Function Documentation

7.11.3.1 createUser()

```
static void com.activitytracker.User.createUser (
    final DBManager dbManager,
    final String name,
    final String emailAddress,
    final int DOBYear,
    final int DOBMonth,
    final int DOBDay,
    final User.Sex sex,
    final float height,
    final float weight,
    final String plaintextPassword ) [static]
```

Definition at line 78 of file User.java.

7.11.3.2 getDateOfBirth()

```
Date com.activitytracker.User.getDateOfBirth ( )
```

Definition at line 111 of file User.java.

7.11.3.3 getEmailAddress()

```
String com.activitytracker.User.getEmailAddress ( )
```

Definition at line 107 of file User.java.

7.11.3.4 getHeight()

```
float com.activitytracker.User.getHeight ( )
```

Definition at line 123 of file User.java.

7.11.3.5 `getID()`

```
int com.activitytracker.User.getID ( )
```

Definition at line 99 of file User.java.

7.11.3.6 `getLastRID()`

```
int com.activitytracker.User.getLastRID ( )
```

Definition at line 115 of file User.java.

7.11.3.7 `getName()`

```
String com.activitytracker.User.getName ( )
```

Definition at line 103 of file User.java.

7.11.3.8 `getSex()`

```
Sex com.activitytracker.User.getSex ( )
```

Definition at line 119 of file User.java.

7.11.3.9 `getWeight()`

```
float com.activitytracker.User.getWeight ( )
```

Definition at line 127 of file User.java.

7.11.3.10 `setLastRID()`

```
void com.activitytracker.User.setLastRID (
    final int rID )
```

Definition at line 117 of file User.java.

7.11.4 Member Data Documentation

7.11.4.1 dateOfBirth

`Date com.activitytracker.User.dateOfBirth [private]`

Definition at line 32 of file User.java.

7.11.4.2 dbManager

`DBManager com.activitytracker.User.dbManager = null [private]`

Definition at line 36 of file User.java.

7.11.4.3 emailAddress

`String com.activitytracker.User.emailAddress [private]`

Definition at line 31 of file User.java.

7.11.4.4 height

`float com.activitytracker.User.height [private]`

Definition at line 34 of file User.java.

7.11.4.5 id

`int com.activitytracker.User.id [private]`

Definition at line 29 of file User.java.

7.11.4.6 name

```
String com.activitytracker.User.name [private]
```

Definition at line 30 of file User.java.

7.11.4.7 sex

```
Sex com.activitytracker.User.sex [private]
```

Definition at line 33 of file User.java.

7.11.4.8 weight

```
float com.activitytracker.User.weight [private]
```

Definition at line 35 of file User.java.

The documentation for this class was generated from the following file:

- [app/src/com/activitytracker/User.java](#)

7.12 com.activitytracker.UserAttribute Enum Reference

Public Attributes

- [ID](#)
- [NAME](#)
- [EMAIL_ADDRESS](#)
- [DATE_OF_BIRTH](#)
- [SEX](#)
- [WEIGHT](#)
- [HEIGHT](#)
- [PASSWORD](#)
- [SALT](#)

7.12.1 Detailed Description

This enumeration type is used to specify the behaviour of generalized methods, particularly in the [DBManager](#) class.

Definition at line 6 of file UserAttribute.java.

7.12.2 Member Data Documentation

7.12.2.1 DATE_OF_BIRTH

```
com.activitytracker.UserAttribute.DATE_OF_BIRTH
```

Currently not used as no generalized method retrieves the user's DOB.

Definition at line 26 of file UserAttribute.java.

7.12.2.2 EMAIL_ADDRESS

```
com.activitytracker.UserAttribute.EMAIL_ADDRESS
```

The user's email address.

Used in [DBManager::getUserStringAttribute](#) to specify that the user's email address should be returned.

Definition at line 22 of file UserAttribute.java.

7.12.2.3 HEIGHT

```
com.activitytracker.UserAttribute.HEIGHT
```

The user's height (in metres).

Used in [DBManager::getUserFloatAttribute](#) to specify that the user's email height should be returned.

Definition at line 42 of file UserAttribute.java.

7.12.2.4 ID

```
com.activitytracker.UserAttribute.ID
```

Currently not used as no generalized method retrieves the user's ID.

Definition at line 10 of file UserAttribute.java.

7.12.2.5 NAME

```
com.activitytracker.UserAttribute.NAME
```

The user's full name.

Used in [DBManager::getUserStringAttribute](#) to specify that the user's name should be returned.

Definition at line 16 of file UserAttribute.java.

7.12.2.6 PASSWORD

```
com.activitytracker.UserAttribute.PASSWORD
```

The user's encrypted password hash.

Used in [DBManager::getUserStringAttribute](#) to specify that the user's password hash should be returned.

Definition at line 48 of file UserAttribute.java.

7.12.2.7 SALT

```
com.activitytracker.UserAttribute.SALT
```

Currently not used as no generalized method retrieves the user's password encryption salt.

Definition at line 52 of file UserAttribute.java.

7.12.2.8 SEX

```
com.activitytracker.UserAttribute.SEX
```

Currently not used as no generalized method retrieves the user's sex.

Definition at line 30 of file UserAttribute.java.

7.12.2.9 WEIGHT

```
com.activitytracker.UserAttribute.WEIGHT
```

The user's weight (in kilograms).

Used in [DBManager::getUserFloatAttribute](#) to specify that the user's email weight should be returned.

Definition at line 36 of file UserAttribute.java.

The documentation for this enum was generated from the following file:
